ģ Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis bevaluating the ability of agents to modulate Smad protein degradation.

Claim 4; Page 35; 75pp; English.

The present sequence is the Smad PY motif consensus sequence. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGP) beta and/or bone morphogenic protein (BMP) mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase wW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular

                                                                                                                                                                 ó
        useful for stimulating bone formation in a patient or treating at condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   motif (AAR97694) of WBP-1 (AAR97695), a ligand of the WW signalling domain of a novel human proto-oncogene associated protein, YAP (AAR9760). The mutant peptides, which also included the amino acids flanking the PY motif, were expressed as GST fusion proteins in B. coli SURE. Binding to the YAP WW domain was virtually abolished when proline P2 (numbered according to position in the PY motif), p3 or YS was substituted by alanine (AAR997698-700, respectively), and reduced approx. 2-fold when P1 or P4 was altered to alanine (AAR98322-23, respectively)
 The method is

containing this rich regions of WBP-1 and WBP-2 proteins. Peptides containing this residue have been shown to bind the YAP ww domain, but not the WW domain from dystrophin or to a panel of SH3 domains. Peptides AMM38057-67 were biotinylated and complexed with alkaline streptavidin, and used in a cross affinity mapping experiment. They were tested for their ability to bind to the 12 individual novel WW domains of WWP1 (AAM36794), WWP2 (AAM36795), WWP3 (AAM37696) and WWP4 (AAM36797), which were expressed as glutathione-S-transferase expression proteins. The present peptide is derived from WBP-1, and binds to some of the WW domains of the novel proteins. The WW domain is a small functional domain. Its name is derived from the observation that two tryptophan cenidues, one in the amino terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WW domain shave a function involving cell signalling and growth regulation of the organisation of the cytoskeleton. Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many the complex. Proteins containing WW domains are used for targeted drug complex. Proteins containing WW domains are used for targeted drug complex. Proteins containing WW domains are used for targeted drug complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

The present sequence is a Smad PY motif consensus sequence. The PY motif binds to the WM domain of HBCT (homologous to BG carboxyl terminus) E3 ubiquitin ligase. resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGP)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insulficient TGP-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for treating inflammation, broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGP-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.

protein bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or EMPP-mediated cell signalling. Agents that inhibit EMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment EMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis The present sequence is a Smad PY motif. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for similating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a Smad PY motif. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitation of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein hECT E3 ubiquitin ligase, or on the cellular levels of Smad protein hECT E3 ubiquitin ligase, or so the cellular levels of Smad protein hECT E3 ubiquitin ligase, or superior is useful for stimulating bone formation in a patient or treating a condition associated with inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for treating cancer, that inhibit TGF-mediated signalling are useful for treating cancer, that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein

The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        activities, or as an immunogen to generate antibodies. This is the amino acid sequence of a Ww domain binding peptide.

                                                                                                                                                                                                                                                                                                                                            The present sequence represents the PY motif of a MAD-1 (mothers against dpp (decapentaplegic)) protein. The specification describes a human endothalial MAD interactor 1 protein EM11. The protein modulates transforming growth factor-beta (TGF-beta) responsive cells. The EM11 protein is used to treat EM11 deficiency. They are especially used for treatment of cardiovascular disease (specifically atterossis but also ischaemia/reperfusion, hypertension, restenosis and arterial inflammation) or proliferative diseases, especially cancer of gut-derived cells, e.g. colorectal or pancreatic cancer, also to modulate angiogenesis, treat autoimmune disease or fibrosis and to
                                                                                                                                                                                                                                                                         Nucleic acid encoding endothelial MAD interactor I - for modulating cell proliferation and differentiation, e.g. in cases of atherosclerosis and
Endothelial MAD interactor protein 1; mothers against dpp; MAD-1; decapentaplegic, human; transforming growth factor-beta; TGF-beta; EMI1 deficiency; cardiovascular disease; atherosclerosis; ischaemia; reperfusion; hypertension; restenosis; arterial inflammation; proliferative disease; cancer; colorectal; pancreatic; antisense; anglogenesis; autoimmune disease; fibrosis; wound healing.

The specification describes a human endothelial MAD interactor I protein EMII. The protein modulates transforming growth factor-beta (TGF-beta) response in TGF beta responsive cells. The EMII protein is used to treat EMII deficiency. They are especially used for treatment of cardiovascular diseases (specifically attencosclerosis but also ischaemia/reperfusion, hypertension, restenosis and arterial inflammation) or proliferative diseases, especially cancer of gut-derived cells, e.g. colorectal or pancreatic cancer, also to regulate wound healing
                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid encoding endothelial MAD interactor I - for modulating cell proliferation and differentiation, e.g. in cases of atherosclerosis and

                                                                                                                                                                                                                                                 ò
                                                                     The present sequence represents the PY motif of a Smad-5 (mothers against dpp (decapentaplegic)) protein. The specification describes a human endothalial MAD interactor 1 protein EMI1. The protein modulates transforming growth factor-beta (TGF-beta) responsive cells. The EMI1 protein is used to treat EMI1 deficiency. They are especially used for treatment of cardiovascular disease (specifically atheroscierosis but also ischaemia/reperfusion, hypertension, restenosis and arterial inflammation) or proliferative diseases, especially cancer of gut-derived cells, e.g. colorectal or pancreatic cancer, also to modulate angiogenesis, treat autoimmune disease or fibrosis and to

                              activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC5812 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58013 to AAC58122 and AAB24021 to AAB24040 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Secretory proteins play important roles in the proliferation control, the differentiation induction, the material transport and the biophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; secreted protein; membrane protein; hydrophobic domain; proliferation control; differentiation induction; material transport; biophylaxis; signal receptor; ion channel; transporter; immunostimulant; immunosuppressant; haematopoiesis regulator; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition; autoimmune disease; Alzheimer's disease; Parkinson's disease; cancer.

cells. Membrane proteins have important roles as signal receptors, ion channels and transporters. The present sequence is a human protein which has at least one hydrophopic domain. This protein may be a secretory or a membrane protein. The present protein may have cytokine and cell proliferationalization activity, immune stimulating or suppressing activity, haematopoiesis activity, issue growth activity, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, anti-inflammatory activity haemour inhibition activity. The present protein could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for Synthesising the full length cDNA are useful length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   830 Primers useful for synthesizing full length cDNA clones and their use

invention. The antibodies specific for the protein of the invention. The antibody may be used for detecting the PRO proteins of the invention and may be used to modify their activity. Polymorleotides may be used as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA or to isolate other CDNAs, to construct hybridisation probes for mapping the gene which encodes that PRO and for genetic probes for mapping the gene which encodes that PRO and for genetic other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the transgenic animals or knock-out animals which in turn are useful in the cheromore identification, and tissue typing. The PRO polypeptides are useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect of conditionance in the proposes of the sequences may also be used to detect for differentially expressed genes using microarray technology. The present sequence represents a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 216 AA;

Comprehensive and their renording polypeptides. The novel polypeptides exhibit activities relating to angiogenesis, cytokine, cell polypeptides exhibit activities relating to angiogenesis, cytokine, cell prolypeptides are involved in the prolypeptides are involved in the coroliferation, differentiation, antification, differentiation and survival of pluripotent and toripotent proliferation, differentiation and survival of pluripotent and toripotent ten cells, and are useful for re-engineering damaged or diseased tissues, transplantation, manufacture of the oppopulates include the stem cells in culture to give rise to neuroepithalal cells that can be used to angment or replace cells damaged by illness, autoimmune disease, accidental damage or genetic disorders. The polypeptides and bean to proliferation of neural cells and regeneration of nerve and bean in tissue and neuropathias, such as Alzheimer's, Farkinson's disease, anyorivorphic lateral scleroais (ALS). The polypeptides are also involved in chemocracic or chemokines activity, regulation of hemmeropoiesis and are useful for the treatment of central and peripheral nervous system which is the properties of the properties, such as Alzheimer's, Farkinson's disease, anyorivorphic lateral scleroais (ALS). The polypeptides are also involved in chemocracic or chemokined; carbory or regulation of hemmeropoiesis and are useful for treating operation of bone, cartilage, tendon, ligament and/or nerve tissue growth, in tissue repair, healing of burns, incisions, ulcers for cregeneration and treatment of lung or liver fibrosis, repetitions and inciding severe combined immunodeficiency (SID) bacterial or fungal in conditions, such as asthma or order respiratory problems. The polypeptides are involved in thromolysis or thrombosis and are useful in treatment of various capallation disorders (sinchiding severe combined immunodeficiency (SID) bacterial or fungation and anabolism, and anabolism, and anebolism, and anabolism, and anebolism, and anebolism, and anebolism, and ana Novel nucleic acids and polypeptides for diagnosis, treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic present invention relates to the isolation of novel human ftp.wipo.int/pub/published\_pct\_sequences Claim 20; SEQ ID NO 419; 300pp; English lateral sclerosis. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2001-327913/34.

Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.

Claim 4; Page 35; 75pp; English.

The present sequence is the Smad PY motif consensus sequence. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) as ubsiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-bets and/or bone morphogenic protein (BMP) mediated signalling of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular

The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF) beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein
levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insufficient TGP-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGP-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            φ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a Smad PY motif. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method introlves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or EMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation,
HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; HECT; homologous to E6 carboxyl terminus; ubiquitination; HECT E3 ubiquitin ligase; antiinflammatory; cytostatic; osteopathic; antimicrobial; neuroprotective; transforming growth factor beta; TGF-beta; bone morphogenic protein; BMP; Smad; cell signalling; inflammation; ageing; cancer; infection; bone anabolism; osteoporosis; renal failure; neurodegeneration; fibrosis; PY motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.
                                                                                                                                                                                                                                                                                 Gaps

The present sequence is a Smad PY motif. The PY motif binds to the WW domain of HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for sequence is provided in a specification relating to a method for sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP) mediated signalling. The method for involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating conne formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer,
                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein
ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.

New Mothers against dpp (MAD) polypeptide (sMAD3d) and polynucleotide -useful as diagnostic reagents and for prevention and treatment of chronic renal failure, atherosclerosis and fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a novel Mothers against ddp (MAD) protein encoded by a splice variant, which is required for the signal transduction of DPP (decapentaplegic). The sMAD3d polypeptides and polynucleotides are useful for diagnosing, preventing or treating diseases including chronic renal failure, atherosclerosis and fibrosis
                  Mothers against ddp; MAD; splice variant; signal transduction;
decapentaplegic; diagnosis; renal failure; atherosclerosis; fibrosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the PY motif of a MAD-2 (mothers against dpp (decapentaplegic)) protein. The specification describes a human endothelial MAD interactor 1 protein EMI1. The protein modulates transforming growth factor-beta (TGF-beta) response in TGF beta responsive cells. The EMI1 protein is used to treat EMI1 deficiency. They are especially used for treatment of cardiovascular disease (specifically atherosclerosis but also ischaemia/reperfusion, hypertension, restenosis and arterial inflammation) or proliferative diseases, especially cancer modulate angiogenesis, treat autoimmune disease or fibrosis and to regulate wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding endothelial MAD interactor I - for modulating cell proliferation and differentiation, e.g. in cases of atherosclerosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                      The present invention relates to peptides capable of interacting with a Smad protein, comprising a Smad Interaction Motif (SIM, amino acid aced protein, comprising a Smad Interaction Motif (SIM, amino acid are a family of highly conserved, intracellular proteins that signal cellular responses downstream of Transforming Growth Factor-beta (TGF-beta) family serine/threonine kinase receptors. The SIM is thought to be necessary for interaction with the MH2 domain of Smad2. The Smad-interacting peptides of the present invention are useful in the necessary for interaction with the MH2 domain of Smad2. The Smad-interacting peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of manufacture of a medicament for the treatment of a patient in need of reducing extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue formation arising from injury or surgery, or reducing scar tissue formation arising from injury to the brain; a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, chronic degenerative diseases, and AIDS), diabetic nephropathy, tumour growth, kidney damage (for e.g. obstructive neuropathy, IgA nephropathy crenal disease) or renal fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                         Polypeptide capable of interacting with a Smad polypeptide, useful in the treatment of cancer and for tissue remodelling or healing of a wound, injury or surgery, comprises a Smad Interaction Motif and is less than 32 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transforming growth factor-beta superfamily signalling; modulator; Smad2; TGF-beta; detection; FAST-1; MH2 domain; Smad interaction domain; SID; treatment; developmental; disorder; immunological; cancer; diagnosis;

                                                                               This sequence represents a human Smad3 protein which is used in a method to detect a compound capable of modulating transforming growth factor-bata feater family signalling. The invention describes a complex which forms between FAST-1 and Smad2 and this complex is specifically induced by signals generated by a TGF-beta superfamily member. A domain of FAST-1 directly interacts with Smad2 and this interaction is mediated by specific domains of the two interaction gonelecules, manaly, the MH2 domain of Smad2 and the Smad interaction domain (SID) of FAST-1. The methods and compounds described are useful for the detection and treatment of conditions involving abnormal TGF-beta superfamily signalling. They can be used to treat e.g. developmental disorders, immunological disorders and cancer. The products can also be used for detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to peptides capable of interacting with a Smad protein, comprising a Smad Interaction Motif (SIM; amino acid sequence PP(T/N) X). The present sequence is a Smad protein. Smad proteins are a family of highly conserved, intracellular proteins that signal cellular responses downstream of Transforming Growth Factor-beta (TGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide capable of interacting with a Smad polypeptide, useful in the treatment of cancer and for tissue remodalling or healing of a wound, injury or surgery, comprises a Smad Interaction Motif and is less than 32 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Smad, Cytostatic, vulnerary, cerebroprotective, immunosuppressive, Anti-HIV; antidiabetic; ophthalmological; antiinflammatory; SIM; Smad Interaction Motif; tissue repair; fibrotic condition; human; immunosuppression; diabetic nephropathy; tumour.

beta) family serine/threonine kinase receptors. The SIM is thought to be necessary for interaction with the MHZ domain of Sma2. The Smadinteraction peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of cately of a medicament for the treatment of a patient in need of reducing extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue remodelling or healing of a wound, injury or bring a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, or injury diseases, and AIDS), diabetic nephropathy, tumour growth, kidney damage (for e.g. obstructive neuropathy, IgA nephropathy or non-inflammatory renal disease) or renal fibrosis

New interacting polypeptide capable of interacting with an activin response factor component, useful in medicine or for the manufacture of a medicament for treating diabetic nephropathy, tumor growth, kidney damage wound healing.

Disclosure; Fig 3; 153pp; English.

The present invention describes a polypeptide (I) capable of interacting (i.e. interacting polypeptide) with an activin response factor (ARF) component. The interacting polypeptide comprises: (a) a Fast motif 1 (FM1) and/or a Fast motif 2 (FM2), and is less than 84, 83, 82, 81, 75, 70, 65, 60, 55, 50, 45, 40, 35, 31, or 30 amino acids in length; ABP53783

CC (b) the amino acid sequence LPTSY (S1) and/or PNXXXP(P/L) (S2) or C (S) (6, 6, 55, 80, 45, 40, 40, 35, 32, 31, or 30 amino acids in length; or (c) a (E, 60, 55, 80, 45, 40, 40, 35, 32, 31, or 30 amino acids in length; or (c) a (EM1 and/or FM2 motif, e.g. the sequence of S1, or 3 or 4 out of 5 of its residues, and is not full-length Xenopus, CC residues, or out of 5 of its residues, and is not full-length Xenopus, CC zebrafish or human FAST1 or its fragment, mouse FAST2 or Xenopus FAST3.

CZ EDATAGISH OF VULDERARY, anti-HIV, antidiabetic and nephrotropic activities. (I) can have a transforming growth factor (TGF) agonist beta, activin agonist or activit antagonist mechanism of activities. (I) can have a transforming growth factor (TGF) agonist beta, activit amedicine or in the manufacture of a ction. (I) can be used in a medicine or in the manufacture of a ction. (I) can be used in a medicine or in the manufacture of a ction of activity member signalling; (ii) with cancer; (iii) cropair and/or regeneration, issue remodeling or healing of a wound, in need of reducing extracellular matrix deposition, encouraging tissue cropair and/or regeneration, issue remodeling or healing of a wound, injury or surgery, or reducing scar tissue formation arising from injury to the brain; or (iv) with or at risk of end-stage organ failure, condition, disease states associated with immunosuppression (e.g. different forms of mangue (e.g. obstructive nephropathy, immunoglobulin A (IgA) nephropathy or non-inflammatory renal disease) or renal fibrosis. The present sequence represents a human smad3 (HSmad3) creal fibrosis. The exemplification of the present invention

                          The present sequence represents a human MAD (Mothers against DPP (Drosophila decapentaplegic) (sic)) homologue, designated MADr3. Different transforming growth factor-beta (TGF-beta) family members may signal through different MAD isoforms. MAD proteins have been found to be required for signal transduction of DPP and BMP2/BMP4. MADr3 and MADr4 polypeptides can be used to stimulate wound healing, to restore normal neurological function after trauma or AIDS dementia, to treat ocular disorders, to target certain cells, to treat kidney and liver disorders, to prevent scarring, to treat ulcers and corneal incisions or to treat cancer. MADr3 antagonists can be used to treat renal failure, wound healing and prevention of scar formation, arthritis, osteoporosis, atherosclerosis, polycystic kidney disease and congestive heart failure. The polypeptides can be used to detect and diagnose disease
                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents human Smad3. The Smad proteins are a family of cytosolic proteins which are involved in TGF-beta superfamily signal transduction. On ligand binding, TGF-beta superfamily proteins (Such as bone morphogenetic protein (BMP), activin and TGF-betas themselves) phosphorylate Smad proteins, which then homo- or heterodimerise and translocate to the nucleus to activate target gene transcription. Smad3 (also known as MADB3, hMAD3 and JV15-2) is a member of a subgroup of Smad family transcription factors, the pathway- restricted Smads, which are regulated by TGF-beta and activins. It can heterodimerise with Smad4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense inhibition of the human Smad3 gene, useful for diagnosing, preventing and treating conditions associated with Smad3 expression e.g.
                                                                                                                                                                                                                                                                                                                          Gaps

(US6013787-A, AAV69622), the complex being able to activate TGF-beta inducible transcription. The invention relates to antisense objognucleotides targetted to the human Smad3 gene, which inhibit its expression. A series of oligonucleotides (AAZ5796-Z59735) were designed to target different regions of the human Smad3 RNA, and were analysed for their effect on Smad3 mRNA levels by quantitative real-time PCR. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with Smad3 expression, such as tumour formation, inflammation and certain infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The C-terminal 20 amino acids of this novel MADr3 polypeptide is an inhibitor (antagonist) of ALKS, a receptor involved in the transforming growth factor-beta (TGF-beta) signalling pathway. ALKS inhibitors can be used to treating diseases and conditions in mammals associated with TGF-beta. MAD (Mothers against DPP) is necessary for signal transduction of DPP (brosophila MAD ALKS inhibitors are useful to treat chronic renal disease, acute renal disease, wound healing, arthritis, osteoporosis, thinky disease, uncertaintend neurological function, ocular disorders, trophic conditions, ulcers, Alzheimer's disease, atherosclerosis, restenosis, diabetic neuropathy and any disease where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating diseases and conditions associated with the human protein MADr3 e.g. atherosclerosis, renal disease and Alzheimer's disease comprises administration of an inhibitor of ALK5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MADr3; decapentaplegic; DPP; MAD; Mothers against DPP; vulnerary; transforming growth factor beta; TGF-beta; anti-arthritic; osteopathic; nephrotropic; cardiant; opthalmological; nootropic; neuroprotective; anti-arteriosclerotic; vasotropic; anti-arteriosclerotic; vasotropic; anti-diabetic.

The present invention relates to peptides capable of interacting with a Smad protein, comprising a Smad Interaction Motif (SIM; amino acid sequence PP(T/N)K). The present sequence is a Smad protein. Smad proteins care a family of highly conserved, intracellular proteins that signal callular responses downstream of Transforming Growth Factor-beta (TGF-Colullar responses downstream of Transforming Growth Factor-beta (TGF-Colullar responses downstream of Transforming Growth Factor-beta (TGF-Colullar responses downstream of Intracellular present in the MH2 domain of Smad2. The Smad-Columpacture of a medicament for the treatment of a patient in need of manufacture of a medicament for the treatment of a patient in need of columpacture of activin or TGF-beta signalling; cancer; a patient in need of and/or regeneration, tissue remodelling or healing of a wound, injury or columpacture actually some formation arising from injury or the trains of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states of associated with immunosuppression (such as different forms of malignancy, chronic degenerative diseases, and AIDS), diabetic nephropathy, tumour convent, kidney damage (for e.g. obstructive neuropathy, IgA nephropathy, con non-inflammatory renal disease) or renal fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Smad; Cytostatic; vulnerary; cerebroprotective; immunosuppressive; Antidiabelt; ophthalmological; antiinflammatory; SIM; Smad Interaction Motil; tissue repair; fibrotic condition; immunosuppression; diabetic nephropathy; tumour.
